UNIWERSYTET PRZYRODNICZY WE WROCŁAWIU

Theory of elasticity and plasticity

Educational subject description sheet

Basic information

Field of study Civil engineering	**Education cycle** 2022/23
Speciality -	**Subject code** ID000000IBU(P)S.MI1BO.2586.22
Organizational unit The Faculty of Environmental Engineering and Geodesy	**Lecture languages** english
Study level Second-cycle (engineer) programme	**Mandatory** optional
Study form Full-time	**Block** major subjects (conducted) in foreign languages
Education profile Practical	**Disciplines** Civil engineering and transport
	Subject related to scientific research Yes
	Subject shaping practical skills Nie

Teacher responsible for the subject	Małgorzata Meissner
Other teachers conducting classes	Małgorzata Meissner

Period Semester 1	**Examination** exam **Activities and hours** lecture: 15 laboratory classes: 15	**Number of ECTS points** 3.0

Goals

C1	The aim of education is to learn about the spatial issues of the theory of elasticity, description of the state displacements, deformations and stresses, basic equations of the theory of elasticity. In particular, it has get to know flat issues of the theory of elasticity, thin plate theory and methods of solving rectangular plates. Is to familiarize with the basics of plasticity theory.

Subject's learning outcomes

Code	Outcomes in terms of	Effects	Examination methods
Knowledge – Student knows and understands:			
W1	The student knows and understands the equations of the theory of elasticity,relationships between displacements and deformations and stresses. Knows Hooke's generalized law. Know thin plate theory and plate solving methods rectangular. Understands the basics of plasticity theoryKnows methods of solving rod systems in border states.	BU_P7S_WG03, BU_P7S_WG04	written exam, oral exam
Skills – Student can:			
U1	The student is able to formulate equations and relationships in theory elasticity. He can determine the state of displacement and strain in thin rectangular plates. Can solve bar systems in the elastoplastic range. He can determine the limit loads in bar systems	BU_P7S_UW03, BU_P7S_UW04	project
Social competences – Student is ready to:			
K1	The student is ready for rational design complex constructions in the elastic range and using the plastic reserve.	BU_P7S_KR06	observation of student’s work

Balance of ECTS points

Activity form	Activity hours*
lecture	15
laboratory classes	15
lesson preparation	15
presentation/report preparation	15
exam participation	6
consultations	10

Student workload	**Hours** 76	**ECTS** 3.0
Workload involving teacher	**Hours** 46	**ECTS** 1.8

Practical workload	Hours 15	ECTS 0.6

* hour means 45 minutes

Study content

No.	Course content	Activities
1.	1. Spatial issues of the theory of elasticity 2. Description of displacement, deformation and stress. 3. Basic equations of the theory of elasticity. 4. Flat issues in the theory of elasticity. 5. Airyego stress function. 6. Thin plate theory. 7. Stress and deformation of a rectangular plate. 8 Methods for solving rectangular plates. Application of series. 9. Methods for solving rectangular plates. Application of the difference method Finite. 10 Basics of plasticity theory. 11. Elasto-plastic bending of statically determinate beams. 12. Elasto-plastic bending of statically indeterminate beams. 13. Elasto-plastic bending of frame beams. 14. Determination of limit loads in statically member systems indeterminate. 15. Repetition.	lecture
2.	1. Solution of multi-span beams using the finite difference method, 2. Solution of a rectangular plate with point support by means of series and by the finite difference method,	laboratory classes

Course advanced

Teaching methods:

lecture, classes

Activities	Examination methods	Percentage in subject assessment
lecture	written exam, oral exam	60%
laboratory classes	project, observation of student's work	40%

Entry requirements

Knowledge of the strength of materials and structural analysis.

Literature

Obligatory

1. Y.C. Fung, Foundations of Solid Mechanics, Prentice-Hall, 1965
2. L. E. Malvern, Introduction to the Mechanics of a Continuous Medium, Prentice-Hall

Optional

1. W. D. Pilkey, W. Wunderlich, Mechanics of Structures , Variational and Computational Methods, CRC Press, 1994

Kierunkowe efekty uczenia się

Kod	Treść
BU_P7S_KR06	Absolwent jest gotów do rozwijania dorobku oraz podtrzymywania etosu zawodu;
BU_P7S_UW03	Absolwent potrafi krytycznie ocenić wyniki analizy numerycznej konstrukcji inżynierskich.
BU_P7S_UW04	Absolwent potrafi wykonać klasyczną analizę statyczną, dynamiczną i stateczności ustrojów prętowych (kratownic, ram i cięgien) statycznie wyznaczalnych i niewyznaczalnych oraz konstrukcji powierzchniowych (tarcz, płyt, membran i powłok).
BU_P7S_WG03	Absolwent zna i rozumie w pogłębionym stopniu zagadnienia Mechaniki Ośrodków Ciągłych. Zna zasady analizy zagadnień statyki, stateczności i dynamiki złożonych konstrukcji prętowych, powierzchniowych oraz bryłowych;
BU_P7S_WG04	Absolwent zna i rozumie w pogłębionym stopniu zagadnienia wytrzymałości materiałów, modelowania materiałów i konstrukcji, teoretycznych Metody Elementów Skończonych oraz ogólnych zasad prowadzenia nieliniowych obliczeń konstrukcji inżynierskich;
